

## Assignment 1

Go to the primary literature (i.e., peer-reviewed original research journal articles ONLY) to find information to explain the concept of phenology as it relates to ecology and environmental science. Each member of your team must find a (different) source. Using ALL of your sources, write an explanation of this concept while providing examples. Include at least 1 hypothesis (explanation that is testable) for how phenology is likely to be impacted by climate change (see CH 1 in your textbook for information on hypotheses). Include in-text citations in proper CSE format (see citation supplement). Use your journal articles as models of how to integrate in-text citations into your writing. This written portion of this assignment should be **no more than 1 page long** but a reference list formatted in CSE style and any supplemental information (graphs, figures, etc.) may be placed on the 2<sup>nd</sup> page.
