Painting turtles: an introduction to species distribution modeling in R (Version 1.0)
By Anna Carter

Module Description:

In this exercise, students will gain insight into the process of building an occurrence-based species distribution model (sdm) by investigating the distribution of painted turtles (*Chrysemys picta*), a semi-aquatic species that is widespread throughout North America. Students will gain familiarity with available sources of climate and distribution data and acquire basic skills for handling geospatial data and spatially-explicit ecological datasets in open-source software. The module contains copy-and-paste code for R as well as example questions that walk students through the exercise and prompt them to critically consider the limitations of spatially-explicit data and occurrence-based distribution models for answering ecological questions. As written, the module does not explicitly examine whether the sdm is a 'good' model for painted turtles. However, this exercise is a simplified version of the vignettes in "Species distribution modeling with R" by Hijmans & Elith (2017) and can be extended to include more advanced exercises, such as statistical exploration of the BioClim variables, model validation, or the effects of climate change.

Teaching Setting:

This module is a flexible, computer-based lab exercise for any number of students to complete, either individually or as a group exercise. Given that students have installed, or otherwise have access to, R and RStudio, the exercises can be completed during a single, 2-3 hour lab period. The exercises can act as a stand-alone assignment or as an introduction to concepts that are explored throughout a course. Students should have basic familiarity with typing and executing commands in the R/RStudio console and have familiarity with basic spatial concepts like latitude/longitude.

Related Materials and Opportunities:

The author of this resource was a participant in the DIG into Data Faculty Mentoring Network of 2017. During this Faculty Mentoring Network, faculty furthered development of their own existing teaching materials using authentic research data in their introductory biology or ecology courses. This resource was then published in a special issue of *Teaching Issues and Experiments in Ecology* (TIEE) (see the TIEE citation below) and is also one of many resources available at the EcoED Digital Library.

Learn more about DIG (Data Incubator Group) and browse all DIG resources.

In this module, students use RStudio, which is one of several free software available on QUBES. Students do not need to install RStudio onto their computer and can instead launch RStudio directly in their browser from the RStudio page on QUBES.

If you use or would like to use R in the classroom, you may be interested in joining the QUBES Community Group: Using R in the classroom, an online community where you can ask questions and share tips and resources related to using R in the classroom.
