Our innovative biology program grounds students in the core concepts and skills of biology while allowing them to pursue areas of special interest in greater depth. All biology majors take the same foundational classes: Integrated Concepts of Biology: Molecules and Cells; Integrated Concepts of Biology: Organisms and Ecosystems; Biologist’s Toolkit; and Principles of Chemistry I and II. After completion of the common core, students can select from one of three tracks of the major: Biology, Molecular and Cellular Biology, or Ecology Evolution and Behavior. Electives and courses from allied science and math disciplines have been chosen to help develop greater depth of knowledge in those subfields of biology. In the senior year, all biology majors join together again in the senior capstone.
