**Course Description**

Analytical and computational methods for statistical analysis of data. Descriptive statistics, graphical representations of data, correlation, regression, causation, experiment design, introductory probability, random variables, sampling distributions, inference and significance.

**Probability Distributions**

When we understand underlying distributions, we can seek proportions.

**Statistical Analyses**

The reaction rates of the reaction $S$ to $P$ catalyzed by enzyme $E$ were determined under conditions such that only very little product was formed.

By realizing the linear relationship between the reciprocal variables, we can compute the maximum reaction velocity asymptote $V_{\text{max}}$ and the Michaelis-Menten constant $K_m$.

**Exploratory Data Analysis Projects**

Each semester, groups of students in Bio 18 compose a month-long project that builds skills in

1. finding and wrangling data
2. reporting exploratory data analysis
3. presenting work in a networking setting

Reports in past semesters included student-selected topics such as food deserts, cats and dogs, video game sales, fish and mercury, mental health, and more!

**Anatomy**

New to the Spring 2019 semester, we can now explore anatomy diagrams using the gganatogram package.

**Program Learning Outcomes**

1. An ability to develop and critique hypotheses and to design experiments, models, and/or calculations to address these hypotheses.
2. The ability to use appropriate instrumentation and computational tools to collect, analyze, and interpret data.
3. The ability to read, evaluate, interpret, and apply numerical and general scientific information.
4. The ability to develop and critique hypotheses and to design experiments, models, and/or calculations to address these hypotheses.
5. The ability to use appropriate instrumentation and computational tools to collect, analyze, and interpret data.

**Probability Distributions**

When we understand underlying distributions, we can seek proportions.

**Statistical Analyses**

The reaction rates of the reaction $S$ to $P$ catalyzed by enzyme $E$ were determined under conditions such that only very little product was formed.

By realizing the linear relationship between the reciprocal variables, we can compute the maximum reaction velocity asymptote $V_{\text{max}}$ and the Michaelis-Menten constant $K_m$.
