

Teaching with Data Projects on QUBES

The QUBES Project (Quantitative Undergraduate Biology Education & Synthesis – QUBESHub.org) has partnered with a wide range of curriculum projects that emphasize the use of research data to teach biology. These projects are taking advantage of the increased availability of research data to address calls for undergraduate education reform, often focusing on providing opportunities for students to gain experience with scientific practices and the development of quantitative competencies. Please have a look around and see what they have made available. If you are interested in working with other teachers to use data in your courses please consider joining a Faculty Mentoring Network.
